

Nameserver

Why do I receive “Nameserver error” while updating a .DE domain?

The DENIC checks the Nameserver settings of every UPDATE of .DE domains. If these are not correct, a “Nameserver error” will be displayed and the Update will fail (UPDATE FAILED).

You can test the Nameserver entries for .DE domains with the DENIC checking tool “NAST”.

This enables you to detect any possible challenges with the Nameserver and the domain settings.

[Click here to get to the “NAST” checking tool.](#)

As soon as the Nameserver entries are without any faults and the “NAST” checking tool does not display any errors, you may again choose “UPDATE” from the Domain List.
